|-----------------------------------|------------------|----------------------------|------------------------------|
|                                   |                  |                            |                              |

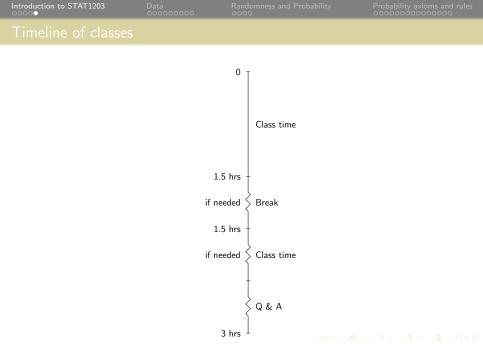

- Course webpage: http://economics.smu.edu.sg/faculty/ profile/9699/Denis%20LEUNG (NOT eLearn!)
- Understanding of basic Calculus and Algebra Appendix in course notes
- Readings *before* each class
- Projects vs Homework
- If you missed a class, it is **your** responsibility to find out what you have missed from your classmates or course webpage
- Do not copy down/memorise formulae blindly. Discard as many formulae as possible as you progress

# Projects

- (1) There will be 2 group projects
- (2) For project administration (submission of reports, *etc.*), each class is assigned a TA, shown previously. However, any TA may be approached for general consultation
- (3) You will work with the same group of fellow students on both projects
- (4) Those who wish to be in the same group should submit ONE email with their names to the TA before the end of Week 4
- (5) Each group submits a schedule of their project meetings (online or in person) to the TA by Week 7
- (6) A group member may miss 1 meeting for each project. If any group member misses more than 1 meeting, his/her project grade as well as class participation grade will be pro-rated by # meetings attended/total # meetings
- (7) Anyone not contactable by email/phone/etc after 3 attempts from their group members will be considered to have agreed on dates/times of meetings; subsequent absence of such individual from meetings follow the same grading guidelines as (6)
- (8) Project reports must be type written in google doc with time stamp indicating each group member's contribution
- (9) Each group receives one grade, notwithstanding (6)-(8) above. I reserve the right to ask any individual(s) to submit separate report(s)

# Sample vs. Population

(a) Data are a **sample** (subset) from a **population** that we want to study

*e.g.*, 753 women (sample) out of all white married women in 1975-1976 (population)

(b) We are interested in some characteristics of the population

*e.g.*, average wage or percentage of women who earned more than minimum wage in the population

- (c) We use a sample to answer questions about the population
- (d) Data = Sample

Data 000000000

# Data structure and terminologies

- Sample size n: number of units (observations) in the sample
- Variables characteristics of the units
  - e.g., Workforce status, hrs worked, age, wage rate, etc.
    - Often represented by symbols, X, Y, Z, etc.
    - Quantitative: numeric eg., Age, wage rate, hrs worked
    - **Qualitative (Categorical)**: Not quantitative (no natural ordering) *eg.*, Gender, colour, race
    - **Discrete**: countable number of values *eg.*, Gender, # kids, # days
    - **Continuous**: uncountably many in a range (*a*, *b*) *eg.*, Wage rate, age (real, not rounded), temperature
- A sample is *n* observations,  $X_1, ..., X_n$ , of X

# Summarising qualitative (categorical) or quantitative data with a few values

| Variable     | Levels | n   | %     |
|--------------|--------|-----|-------|
| in workforce | 0      | 325 | 43.2  |
|              | 1      | 428 | 56.8  |
|              | all    | 753 | 100.0 |
| # kids < 6   | 0      | 606 | 80.5  |
|              | 1      | 118 | 15.7  |
|              | 2      | 26  | 3.4   |
|              | 3      | 3   | 0.4   |
|              | all    | 753 | 100.0 |
| education    | 5      | 4   | 0.5   |
|              | 6      | 6   | 0.8   |
|              | 7      | 8   | 1.1   |
|              | 8      | 30  | 4.0   |
|              | 9      | 25  | 3.3   |
|              | 10     | 44  | 5.8   |
|              | 11     | 43  | 5.7   |
|              | 12     | 381 | 50.6  |
|              | 13     | 44  | 5.8   |
|              | 14     | 51  | 6.8   |
|              | 15     | 14  | 1.9   |
|              | 16     | 57  | 7.6   |
|              | 17     | 46  | 6.1   |
|              | all    | 753 | 100.0 |

#### frequency distribution

- tells us <u>everything</u> about a categorical variable
- gives # observations within each category/level
- Most easily displayed using a table
- Proportions or percentage in each category or level, *eg.*,

$$\begin{array}{rcl} \frac{325}{753} &=& \frac{325}{753} \times 100 \text{ percent} \\ &\approx& 43.2 \text{ percent} \end{array}$$

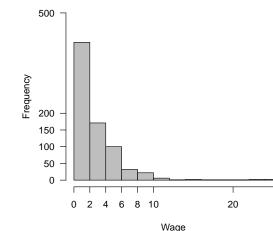

Class 1 Slide 10

Introduction to STAT1203

Data 000000000 andomness and Probability

Probability axioms and rules

# Summarising quantitative data (continuous or discrete with many values

- Histogram is a useful graphical summary for quantitative data
- Groups observations into bins
- Bin width defines grouping
- Height (area) of bin proportional to group size
- Most women earned < \$2 an hour; few earned > \$10

#### Summarising quantitative data – average

#### Numerical summaries

 Sample mean, median – measure "typical" or "average" value of the data

eg., 
$$X_1, ..., X_{10} = 1, 1, 4, 2, 5, 2, 2, 3, 3, 4$$

(a) Sample mean

$$\bar{X} = \frac{X_1 + X_2 + \dots + X_n}{n} = \frac{1}{n} \sum_{i=1}^n X_i = \frac{1 + 1 + 4 + \dots + 3 + 4}{10} = 2.7$$

(b) Sample median - "middle" observation when data are ranked from lowest to highest. If n = odd, sample median= middle value. If n = even, sample median = the average of the two middle values 1,1,2,2, 2,3,3,4,4,5

$$\frac{2+3}{2} = 2.5$$

## Summarising quantitative data – average (2)

Add an observation  $X_1, ..., X_{11} = 1, 1, 4, 2, 5, 2, 2, 3, 3, 4, 50$ 

(a) Sample mean

$$\bar{X} = \frac{1+1+4+\ldots+3+4+50}{11} = 7.7$$

(b) Sample median = 3

1,1,2,2,2, 3 ,3,4,4,5,50

(c) Mean is sensitive to the change but median is not

Mean uses 1,1,4,2,5,2,2,3,3,4,50

- Median uses 3
- Mean uses information from every observation
- Mean not representative of the average when there are extremes
- Mean better represents the average when there are no extremes

#### Introduction to STAT1203

Data 0000000

#### Summarising quantitative data – spread

- Spread describes how the value of a variable changes over n observations
- Sample range, variance  $(s^2)$ , interquartile range (IQR)

eg. 
$$X_1, ..., X_{10} = 1, 1, 4, 2, 5, 2, 2, 3, 3, 4$$

- (a) Sample range = largest smallest = 5 1 = 4
- (b) Sample variance = average "distance" between observations and  $ar{X}$

$$s^{2} = \frac{\sum (X_{i} - \bar{X})^{2}}{n - 1^{a}} = \frac{(1 - 2.7)^{2} + ... + (4 - 2.7)^{2}}{10 - 1} \approx 1.79$$

Taking square root gives standard deviation (s)

(c) 
$$IQR = upper quartile (75-th percentile) - bottom 25\% (25-th percentile) 1,1, 22,2,2,3,3, 4,4,5  $IQR = \frac{3+4}{2} - \frac{1+2}{2} = 3.5 - 1.5 = 2$$$

<sup>a</sup> Alternatively use n

(日)

|                          | Data<br>○○○○○○○○ |            |  |
|--------------------------|------------------|------------|--|
| Summarising quanti       |                  | spread (2) |  |
| Range uses               | 1                | 5          |  |
| s <sup>2</sup> and s use | 1,1,4,2,5,2,2    | 2,3,3,4    |  |
| IQR uses                 | 1,2              | 3,4        |  |

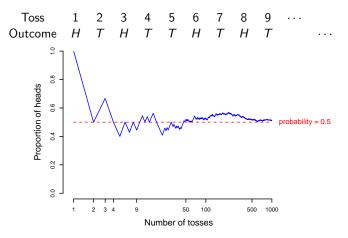

- $s^2(s)$  uses information from every observation
- Range uses only the extreme observations
- $s^2(s)$  and range not representative of the spread when there are extremes
- s<sup>2</sup> (s) is better than range to represent the spread when there are no extremes since s<sup>2</sup> (s) uses more information
- When there are extremes, IQR is the best because it ignores the extremes

|             |  | Randomness and Probability<br>●○○○                                    |              |

# Definition of probability - Tossing a fair coin

A fair coin has a  $\frac{1}{2}$  "probability" of observing heads, what does it mean?

Randomness and Probability

The long run proportion (frequency) of heads is the probability of heads

- Probability is the long run frequency of an outcome
- Probability cannot predict individual outcomes
- However, it can be used to predict long run trends
- Probability always lies between 0 and 1, with a value closer to 1 meaning a higher frequency of occurrence
- Probability is numeric in value so we can use it to:
  - compare the relative chance between different outcomes (events)
  - carry out calculations

| Randomnes |  |
|-----------|--|
| 0000      |  |

# Proportion and probability

• Toss of fair coin: H, T, H, T, T, H, T, H, T

| Outcome           | Н   | Т   |
|-------------------|-----|-----|
| Sample Proportion | 4/9 | 5/9 |
| Probability       | 1/2 | 1/2 |

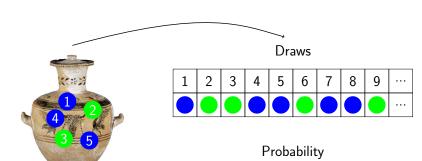

Treatment outcome

| Outcome           | 0      | 1      |
|-------------------|--------|--------|
| Sample Proportion | 40/100 | 60/100 |
| Probability       | P(0)   | P(1)   |

• Probabilities are *population* proportions

 Probability Axioms - Urn model (1)- drawing marbles from an urn

| Introduction to STAT1203 | Data<br>000000000 | Randomness and Probability | Probability axioms and rules<br>○●○○○○○○○○○○○○○ |
|--------------------------|-------------------|----------------------------|---|
| Urn model (2)            |                   |                            |   |

- Five possible **Outcomes**: **1 2 3 4 5**
- Interested in **Event** A:
- A={ **1 4 5**}; hence an event is a collection of outcomes

• 
$$P(A) = \frac{3}{5} = 0.6(60\%) = \frac{\text{Number of marbles in } A}{\text{Total number of marbles}}$$

|                   |  | Probability axioms and rules |
|-------------------|--|------------------------------|
| Complementary eve |  |                              |

- Marbles in urn: 1 2 3 4 5
- Interested in  $\overline{A}$ : (Not A)
- Ā={ **2 3**}
- $\bar{A}$ , sometimes written as  $A^C$ , is called the **complementary** event of A
- Chance of  $\bigcirc = 1 \text{chance of } \bigcirc$

$$\Rightarrow \mathrm{P}(\bar{A}) = 1 - \mathrm{P}(A) = 1 - \frac{3}{5} = \frac{2}{5}$$

- Joint probability and disjoint events
  - A **joint probability** between two events *A* and *B* is one of the following:

 $P(A \text{ and } B) \quad P(A \cap B) \quad P(AB)$ 

 The simplest form of joint probability between A and B is when they are **disjoint** (also called **mutually exclusive**).
 Disjoint events cannot occur simultaneously: P(A and B)=0

# Example

 $A = \{ \bigcirc \text{ in 1st draw} \}$  $B = \{ \bigcirc \text{ in 1st draw} \}$ 

$$P(A \text{ and } B) = 0$$

| Introduction to STAT1203 | Data<br>000000000 | Randomness and Probability | Probability axioms and rules |
|--------------------------|-------------------|----------------------------|------------------------------|
| Partition rule           |                   |                            |                              |

• For any *A*, a partition is any collection of disjoint subsets of *A* that together make up *A*, *eg*.,

If  $A = \{a \| white women\}$ , a partition of A is  $A_1 = \{a \| white women with wage < 3\}$  and  $A_2 = \{a \| white women with wage \ge 3\}$ 

• For any A, P(A) can be written as the sum of the probabilities of its disjoint subsets, *eg.*,

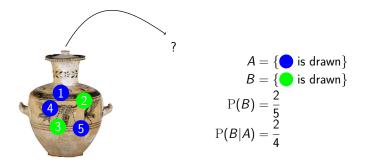

$$P(\bigcirc) = P(\bigcirc \text{ and odd}) + P(\bigcirc \text{ and even})$$
  
= P({1 5}) + P({4})  
=  $\frac{2}{5} + \frac{1}{5}$   
=  $\frac{3}{5}$ 

# Conditional probability

**Conditional probability** is a useful quantification of how the assessment of chance changed due to new information: "If A happened, what is the chance of B?"

The conditional probability of "B given A" is written as P(B|A)

Example Drawing marbles WITHOUT replacement

# Joint probability and the multiplication rule

• The most general way of calculating joint probability is the **Multiplication Rule** 

$$P(AB) = P(B|A)P(A) = P(A|B)P(B)$$

# Example Marbles in urn: 1 2 3 4 5 $P(\bigcirc \text{ and even}) = P(\text{even}|\bigcirc)P(\bigcirc) = \left(\frac{1}{3}\right)\left(\frac{3}{5}\right) = \frac{1}{5}$ $= P(\bigcirc|\text{even})P(\text{even}) = \left(\frac{1}{2}\right)\left(\frac{2}{5}\right) = \frac{1}{5}$

• Rearranging the multiplication rule:

$$P(A|B) = \frac{P(AB)}{P(B)}$$
 and  $P(B|A) = \frac{P(AB)}{P(A)}$ 

| Introduction to STAT1203 | Data<br>00000000 | Randomness and Probability | Probability axioms and rules |
|--------------------------|------------------|----------------------------|------------------------------|
|                          |                  |                            |                              |

- A and B are **independent** means they don't offer information about one another
- If A and B are independent, conditional probability becomes unconditional:

(i) P(A|B) = P(A) "B says nothing about A"

(ii) P(B|A) = P(B) "A says nothing about B"

 Independence is NOT the same as mutually exclusive (disjoint), which is P(A and B) = 0. In fact when A and B are disjoint, they are very dependent Introduction to STAT1203 00000

Data

Randomness and Probability

Probability axioms and rules

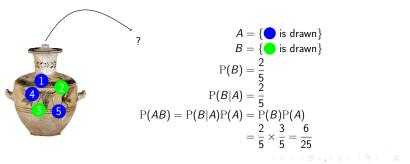

#### Joint probability of independence events

When A and B are independent, using the multiplication rule and, (i) or (ii) from previous slide:

(iii)  $P(AB) = \overbrace{P(A|B)}^{=P(A)} P(B) = P(A)P(B)$ 

We can use (i), (ii) or (iii) for any two independent events A and B

Example Drawing marbles WITH replacement

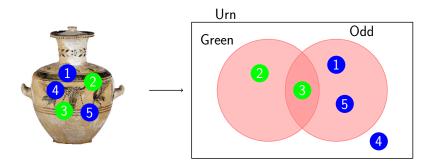

Data 00000000 Randomness and Probability

Probability axioms and rules

# Union of events (1)

**Union** of events can sometimes be best visualized using a **Venn diagram** (John Venn, 1834-1923) Example What is the probability of drawing a or an odd number ?

| Introduction to STAT1203 | Data<br>000000000 | Randomness and Probability | Probability axioms and rules |
|--------------------------|-------------------|----------------------------|------------------------------|
|                          |                   |                            |                              |

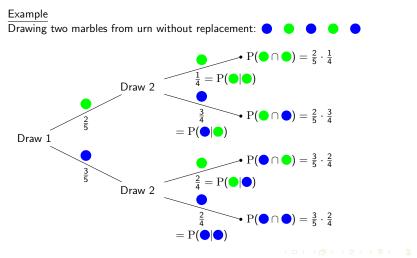

P( or odd) = P( ) + P(Odd) - P( and odd)  
= 
$$\frac{2}{5} + \frac{3}{5} - \frac{1}{5}$$
  
=  $\frac{4}{5}$ 

In general, if A and B are:

- disjoint, then P(A or B) = P(A) + P(B)
- not disjoint, then P(A or B) = P(A) + P(B) P(AB)

## Probability tree

Probability tree is useful for studying combinations of events. Branches of a tree are *conditional* probabilities.

Introduction to STAT1203

Data

Randomness and Probability

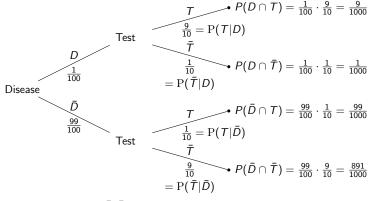

Probability axioms and rules

# Bayes Theorem (Thomas Bayes, 1701-1761)

Trees are useful for visualizing P(B|A) when B follows from A in a natural (time) order. Many problems require P(A|B), **Bayes Theorem** provides an answer.

#### Example

Testing for an infectious disease.

What is P(D|T) or  $P(\overline{D}|\overline{T})$ ?

Class 1 Slide 32

|                   |  | Probability axioms and rules |
|-------------------|--|------------------------------|
| Baves Theorem (2) |  |                              |

$$P(D|T) = \frac{P(D \cap T)}{P(T)} = \frac{P(T|D)P(D)}{P(T)}$$

$$= \frac{P(T|D)P(D)}{P(T \cap D) + P(T \cap \overline{D})}$$
Partition rule
$$= \frac{P(T|D)P(D)}{P(T|D)P(D) + P(T|\overline{D})P(\overline{D})}$$
Multiplication rule
$$= \frac{\frac{9}{10} \cdot \frac{1}{100}}{\frac{9}{10} \cdot \frac{1}{100} + \frac{1}{10} \cdot \frac{99}{100}} = \frac{9}{108}$$
In general,
$$P(B|A)P(A)$$

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

Class 1 Slide 33
